

2-PICKUP INSTRUMENT WITH SEPARATE VOLUME AND TONE CONTROL

This is a suggested wiring diagram that will let you use our **PTM-T2** board with your 2-pickup instrument that uses a separate volume and tone control for each pickup.

Warning: If your pickups have metal cases, they must not be grounded (either case or wire ground) or the PTM switching system will not work in the correct and intended way. If either of your pickup cases are metal and they are grounded (you can determine this by using an ohmmeter to see if there is electrical continuity between each of the pickup leads and the case), you will need to electrically isolate the metal pickup case from ground sources, such as conductive shielding in the body cavity, etc.
